PROFESSIONAL SUMMARY

Senior Laravel / full stack developer with 8 years of experience building business-critical web systems, REST APIs and AI-powered features. For the past year I have been the technical owner and lead developer of **BioMarket ERP**, a production platform for a retail chain that I started from an empty repository in October 2025. I write the code, review and merge the team's work, ship releases, run the server and backups and manage the database. I am looking for a senior or lead role where one person who owns delivery end to end creates value.

2,083 commits in 13 months (70% of the project)	**~260** pull requests released to production in 9 months	**673** database migrations on live data	**51** scheduled jobs running unattended

EXPERIENCE

BioMarket / HealthStore – Lead Developer & Technical Owner — Oct 2025 – Present

Internal ERP for a retail chain · Laravel 12, PHP 8.3, MySQL/MariaDB

- Designed and built the ERP from scratch (HR and shifts, payroll, warehouse, POS, couriers, B2B, CRM, fleet, internal mail). It replaced spreadsheets and manual processes and is used daily by store, warehouse and office staff.
- Led delivery for two additional developers (from Jan and Sep 2026): authored 336 of 550 pull requests, merged about 90% of all 599 merged PRs and decided what reaches production.
- Built the quality pipeline: GitHub Actions CI, Pint, PHPStan level 9, parallel PHPUnit (220 test files), Composer audit, and a custom static check that fails any SQL write outside a transaction.
- Run production end to end: shared hosting (cPanel), cron and queue workers, daily database and code backups with locking and retention, a load-aware scheduler for 51 jobs with a daily email report, and schema changes on live data without data loss.
- Integrated Econt, Speedy and Box Now (including signed webhooks), the PRIM supplier API, OpenCart storefronts, IMAP mailboxes, Google Business reviews, bank payout files and Tuya IoT access control.
- Implemented role and category based access control, IP whitelisting and security fixes (XSS, input validation); wrote user documentation in Bulgarian and access-control documentation in Bulgarian and English.

Devrix – Full Stack Developer — 2025 – Present

- Built and maintained Laravel and WordPress solutions; delivered third-party API integrations.
- Improved application performance and reliability; implemented custom plugins and themes and fixed production bugs.

Freelance – Full Stack Developer (ERP / AI / Booking) — 2021 – Present

- Delivered ERP systems, AI platforms and booking solutions covering architecture, REST APIs and deployment. Projects include CO2 impact systems, a real estate CMS and donation platform integrations.
- Apr 2025: built a Training and Test Management ERP with Laravel and Bootstrap: categories, tests, questions, bulk answers, learning and test modes, result tracking and permission-based content.

Bteam – Full Stack Laravel Developer — Sep 2023 – Apr 2025

- Backend development for voucher systems and REST APIs; built new features, fixed production bugs and developed custom WordPress plugins.

Looming Tech – Full Stack Laravel Developer — Jun 2021 – Jun 2023

- Built Laravel systems with Orchid Admin and Vue dashboards; delivered REST APIs and Docker-based deployments.

Shippii Technologies – Laravel / OctoberCMS Backend Developer — Nov 2019 – May 2021

- Worked on a shipping platform: architecture, refactoring, new features and production backend issues.

HOW I WORK

Fast and continuous. About 160 commits a month and 6–7 per working day. The first 500+ commits of the ERP, covering its core modules, were delivered alone in three months. Roughly six PRs a week reach production.

End-to-end ownership. I take a requirement from a conversation with store staff to code, review, release and monitoring, and I fix production problems myself. About 28% of my work is fixes driven by live feedback.

Pragmatic with legacy. A short, reviewed exclusion list for old files instead of silently suppressing new errors; dead code is deleted, not kept.

Quality at speed. An automated gate (formatting, static analysis, tests, security audit) runs before every merge, so speed does not cost stability.

Operations-minded. I design for the server I run: overlap locks, load guards, retries, backups and nightly job schedules based on measured run times.

Clear communication. I explain technical trade-offs to non-technical managers, and I document what I build for users and for the team.

TECHNICAL SKILLS

Backend: PHP 8.x, Laravel (7+ years; 12 and 13), Eloquent, queues, scheduler, events, REST APIs (Sanctum), webhooks, OctoberCMS, WordPress plugins and themes

Frontend: Blade, JavaScript, Ajax, Vue, React, Next.js, Bootstrap, Tailwind CSS, Alpine.js, Vite

Databases: MySQL / MariaDB (migrations on live data, query optimisation, backups), PostgreSQL, SQLite

Quality: PHPUnit, ParaTest, PHPStan level 9, Pint, custom static analysis rules, Composer audit, code review

DevOps: GitHub Actions CI, Docker, cron and queue workers, cPanel, SSH, FTP, Nginx, backup strategy, release management

Integrations: Econt, Speedy, Box Now, OpenCart REST, IMAP / SMTP, Google APIs, bank files, IoT (Tuya), OpenAI

Security: role and category access control, IP whitelisting, XSS and input validation, dependency audit

Process: GitHub, Bitbucket, Jira, Trello, Monday, Git flow with pull requests, technical documentation

AI SKILLS

- OpenAI API in Laravel applications: generated questionnaires and tests, booking suggestions, SEO content. AI features are optional layers that never block the core flow.
- Prompt engineering, structured outputs with validated answer keys, embedding AI in full stack products, and an AI career assistant on my portfolio.
- Daily use of AI coding assistants (Claude Code) under the same review and quality gate as the rest of the code.

PROJECTS

BioMarket ERP – Retail Operations Platform · Internal system, 2025 – present

Laravel 12 · PHP 8.3 · MySQL/MariaDB · Bootstrap 5 + Tailwind 4 · PHPStan L9 · GitHub Actions

One application for HR and shifts, payroll, warehouse, POS, couriers, B2B, CRM, fleet and internal mail: 220+ models, about 470 pages, 10 service domains, 119 console commands and 2,900+ commits (3 contributors). Every module works with live business data.

Challenge: grow quickly across money, stock and payroll without regressions or outages on a shared host. **Solution:** a mandatory quality gate (Pint, PHPStan 9, ParaTest, audit, transaction check), per-domain service classes, a load-aware nightly job schedule with daily reporting, automated backups, and a reviewed exclusion list for legacy files.

AI Questionnaire System

Live demo · GitHub · Laravel 12 · OpenAI · Sanctum

AI-generated multiple-choice quizzes with automatic scoring, points and time limits, a full REST API, CSV export and shareable QR links. Fixed local SSL failures (cURL error 60) with a configurable CA bundle instead of weakening production security.

BookingAI – Smart Booking System

Live demo · GitHub · Laravel 13 · OpenAI · Sanctum

Multi-tenant booking for salons, studios and consultants: multiple businesses and venues, working hours, onboarding wizard and a versioned REST API. AI slot suggestions are optional and gated behind an API key so booking never depends on it.

Email Client – Browser IMAP System

Live demo · GitHub · Laravel 13 · IMAP · Sanctum

Multi-account IMAP/SMTP client with server autodiscovery and a layer that normalises folder names across providers.

SEO Platform – AI Content & SEO Tool

Live demo · GitHub · Laravel 13 · OpenAI · WordPress

AI-drafted articles with SEO metadata, keyword ideas, competitor comparison and one-click publishing to WordPress through its REST API.

Other repositories

F1 Live Results (PHP proxy with caching for the OpenF1 API, code) · traffic_tracker (visitor tracking, geolocation, dashboards, Swagger) · booking-hotel-app (PMS sync via queued jobs) · Credit-Payment-System and credit-system (loans, APR calculation) · wp_CMS_real_estate, haircut_booking, wp-api-hotel-booking, football_results_live_data (WordPress plugins) · openAIChatGTP · SQLBuilder-Laravel

EDUCATION

Bachelor of Engineering in Information and Communication Technology, VIA University College, Denmark (2015 – 2018). Java, .NET, SQL, Android, networking. Final project: Laravel-based classified ads platform for musical instruments.
Java Development and Business Management, Vejle Teknik Skole, Denmark (2003 – 2006).

TESTIMONIALS

"Aleksander works in a structured way and communicates clearly — the Laravel modules and WordPress integrations were delivered on time, with real attention to maintainability." — Tech Lead, SEO Healthstore

"Strong Laravel backend contribution to our voucher system: clear API contracts, predictable releases, and fast turnaround on production priorities." — Project Manager, Bteam

"A reliable WordPress and Laravel partner — understands the business context, cares about code quality, and communicates well with the team." — CEO, Devrix
